

SAGASQL

Schema-Driven Agentic SQL Generation

Agenda

About BAYOR Cloud & AI Solutions

Why SAGASQL ?

Product Overview

Who benefits first ?

Pricing and availability

Built to boost people, not replace them

Founded by Mohamed Bayor to build AI-powered cloud-native solutions that help teams move faster, safer and with more confidence

1 Mohamed Bayor

Software engineer since 2007, focused on enterprise applications, Java backends, APIs, databases and integration work

2 BAYOR focus

AI-powered cloud-native solutions for real systems, existing applications and practical modernization

3 Human-centered AI

The goal is not to replace developers or business teams. The goal is to **boost how people build, test, document and decide**

Our first MVP: SAGASQL.
Built to boost capabilities across engineering, data and business teams

Relational databases are still everywhere

Oracle, SQL Server, PostgreSQL, MySQL and many existing applications still depend on SQL

1

New queries never stop

Existing apps, dashboards, reports and support workflows constantly need new SQL

2

Raw SQL still matters

Even with ORM tools, developers often test raw SQL first before coding the final query

3

Complex SQL is hard

Performance, joins, security and business correctness often require expert review

4

Reporting can be costly

Many reporting tools still depend on complex SQL plus a user interface

SAGASQL targets the gap between “*AI can write SQL*” and “*teams can safely trust, test and use SQL*”

From business question to validated SQL

SAGASQL — New Request

API-first MVP request setup

1 Business question

Show customers with unpaid invoices over 30 days

2 Schema input (DDL)

```
CREATE TABLE customers (...);
CREATE TABLE invoices (...);
CREATE TABLE payments (...);
FOREIGN KEY customer_id ...
```

3 Execution options

AI mode

Single model | Two-model consider

Test data rows

10 / 100 / 1000+ per table

Test data source

Generated or client-uploaded CSV

Pagination

Default 10 records per page

SQL scope

Read-only SELECT for MVP

Start Workflow

Future UI path: businesss-friendly reports, charts,...

SAGASQL — Validated SQL Result

Final SQL with sandbox evidence

Final SQL

```
SELECT c.customer_name, i.invoice_id,
       i.balance_due, i.due_date
FROM customers c
JOIN invoices i ON i.customer_id = c.customer_id
WHERE i.status = 'UNPAID'
      AND i.due_date < CURRENT_DATE - INTERVAL '30 days'
ORDER BY i.due_date ASC;
```

Test evidence

Status	SUCCESS
Rows returned	116
Page size	10
Execution time	420 ms
Decision	Ready for review

Preview results (sandbox test data)

customer_name	invoice_id	balance_due	due_date
Acme Supplies	INV-1008	\$1,240.00	2025-04-04
Northwind Labs	INV-1011	\$870.00	2025-04-07
Bluebird Systems	INV-1009	\$2,150.00	2025-04-10

Initial support: PostgreSQL, MySQL and SQL Server. More dialects over time.

From technical teams to business users

Start with safer SQL for technical teams. Grow into advanced AI-powered reporting tool for business teams.

1 Engineers (Devs, Testers, DBAs,...)

Generate, test and review SQL before adding it to applications or services

2 Product & App Teams

Support database-backed features, business rules, usage, billing and customer workflows

3 BI & Data Teams

Reduce repeated ad hoc SQL requests and move faster from question to report-ready result

4 Business Users

Ask plain-language questions today. Richer charts, tables and reporting UI are planned next

One engine. Two levels of value: safer SQL for technical teams, clearer answers for business teams

SaaS availability first. Pricing after pilot validation.

A

SaaS access

Accessible outside organizations through secure company accounts and user-level access

B

Early access pilot

Selected organizations will help validate real schemas, usage patterns and support needs before public pricing

C

What affects cost

Users, schemas, model mode, validation volume, sandbox usage, storage, security needs and integration support

**Pricing details will be announced after pilot feedback.
Monthly and annual subscription options are planned.**

Let's build the right Cloud + AI solution

SAGASQL MVP: a SaaS example of secure AI integration in a cloud-native app

SAGASQL shows the pattern

Chat UI + API, workflow tracking and cloud validation

Your internal need may differ

Documentation, onboarding, reporting,
SQL, developer workflows or process automation
